

Case Study | eCommerce Website

This analysis focused on understanding user behavior across an eCommerce website's funnel, from homepage visits to final confirmation. Interaction data was used to identify drop-off points, compare segments, and surface actionable patterns.

Users by stages

Home

90.40K

All → 100.00%

Search

45.20K

home to search → 50.00%

Payment

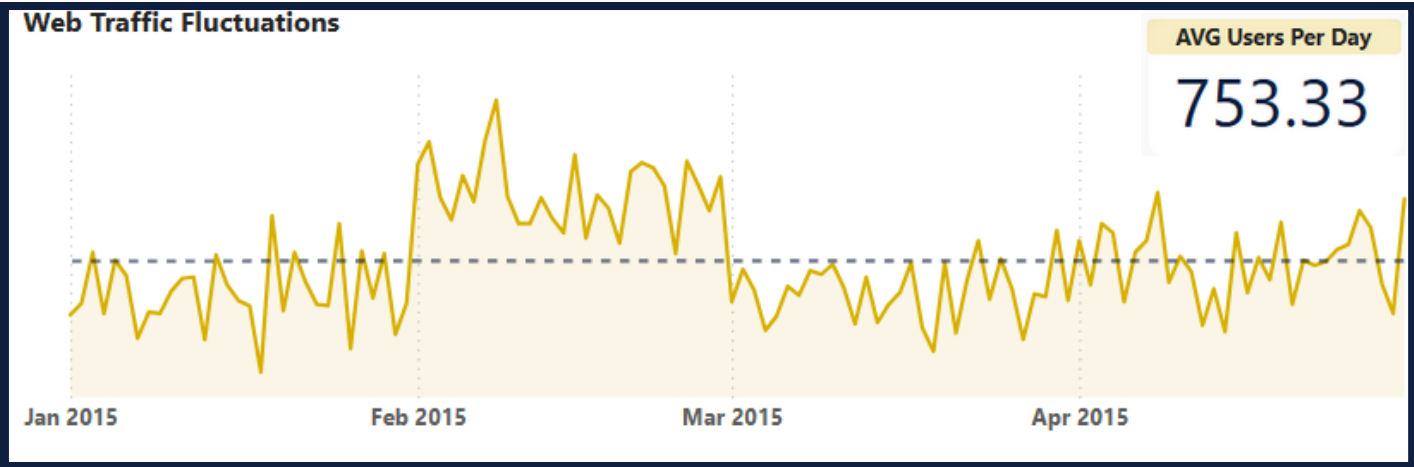

6,030

home to payment → 6.67%

Confirmation

452

home to conf → 0.50%

	stage	users	pct_from_home
▶	Home	90400	100.00
	Search	45200	50.00
	Payment	6030	6.67
	Confirmation	452	0.50

Funnel Overview

From 90K users landing on the homepage, only 452 reach the confirmation stage, that’s a **99.5%** drop-off.

The biggest drop happens right after landing: 50% leave before using the search function.

Note: Additional filters and interactive views are available in the Power BI dashboard.

Funnel Conversion Breakdown

Where are users dropping off across the journey?

Conversion by stage

From home to search page

50.00%

From search to payment page

13.34%

From payment to confirmation page

7.50%

- Only 13.34% continue from Search to Payment.
- Just 7.5% of users who start payment end up confirming.

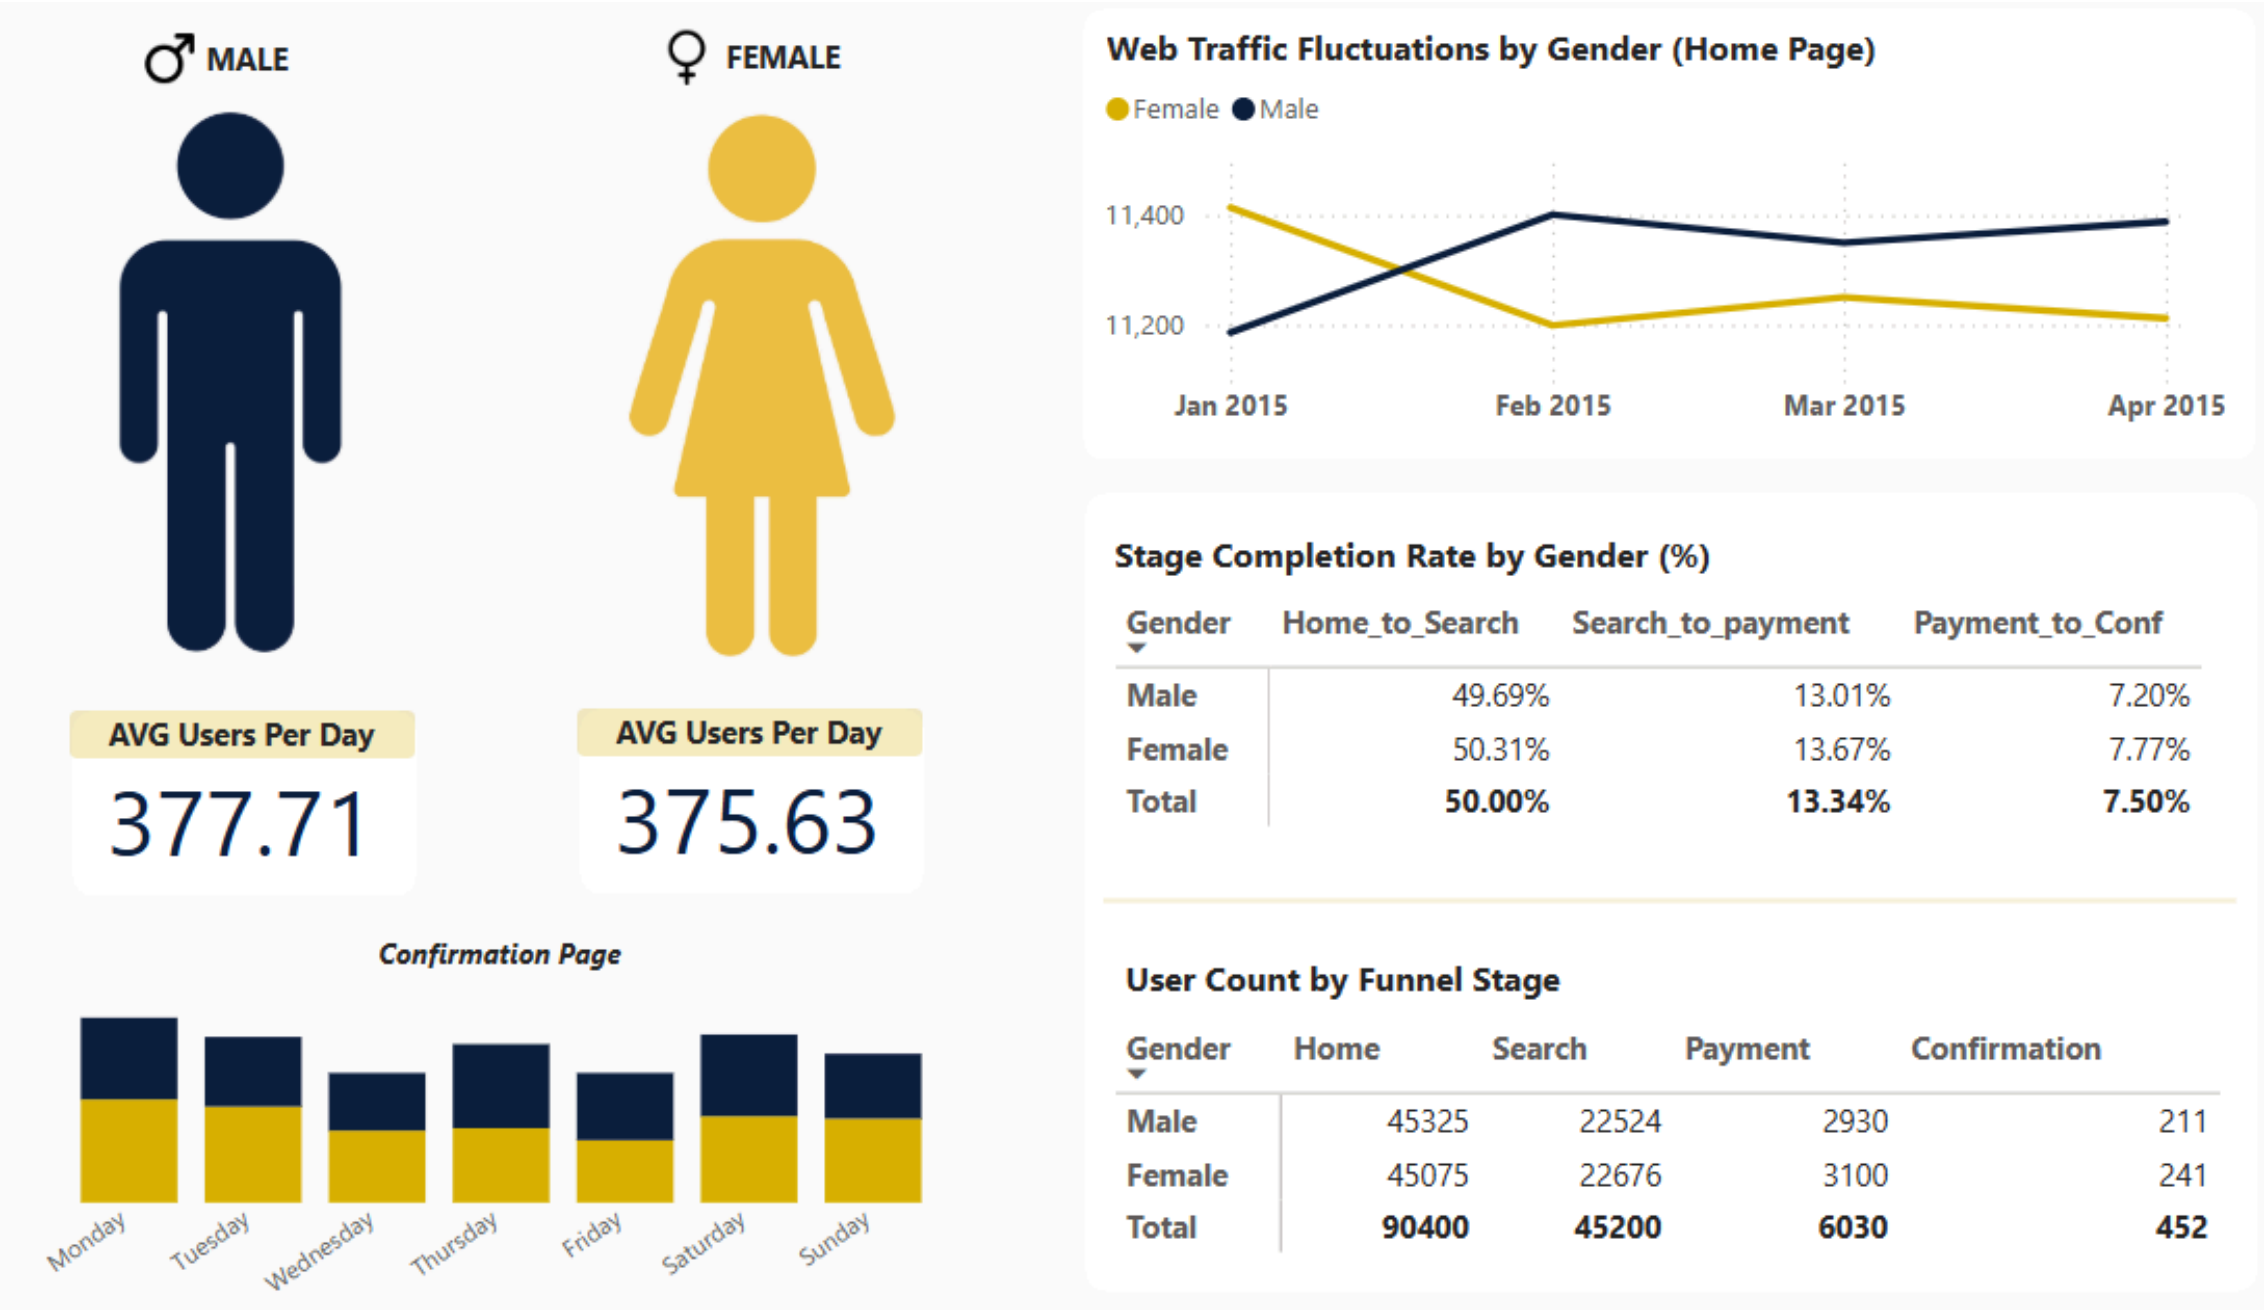

Imagine 100 users reaching the payment stage, only about 8 of them actually complete the process.

That's exactly what's happening here: a 7.5% conversion from payment to confirmation.

Note: Additional filters and interactive views are available in the Power BI dashboard.

Conversion Rates by Gender

Gender is not the issue

Both male and female users show nearly identical behavior across the funnel.

Female: 7.77% conversion rate

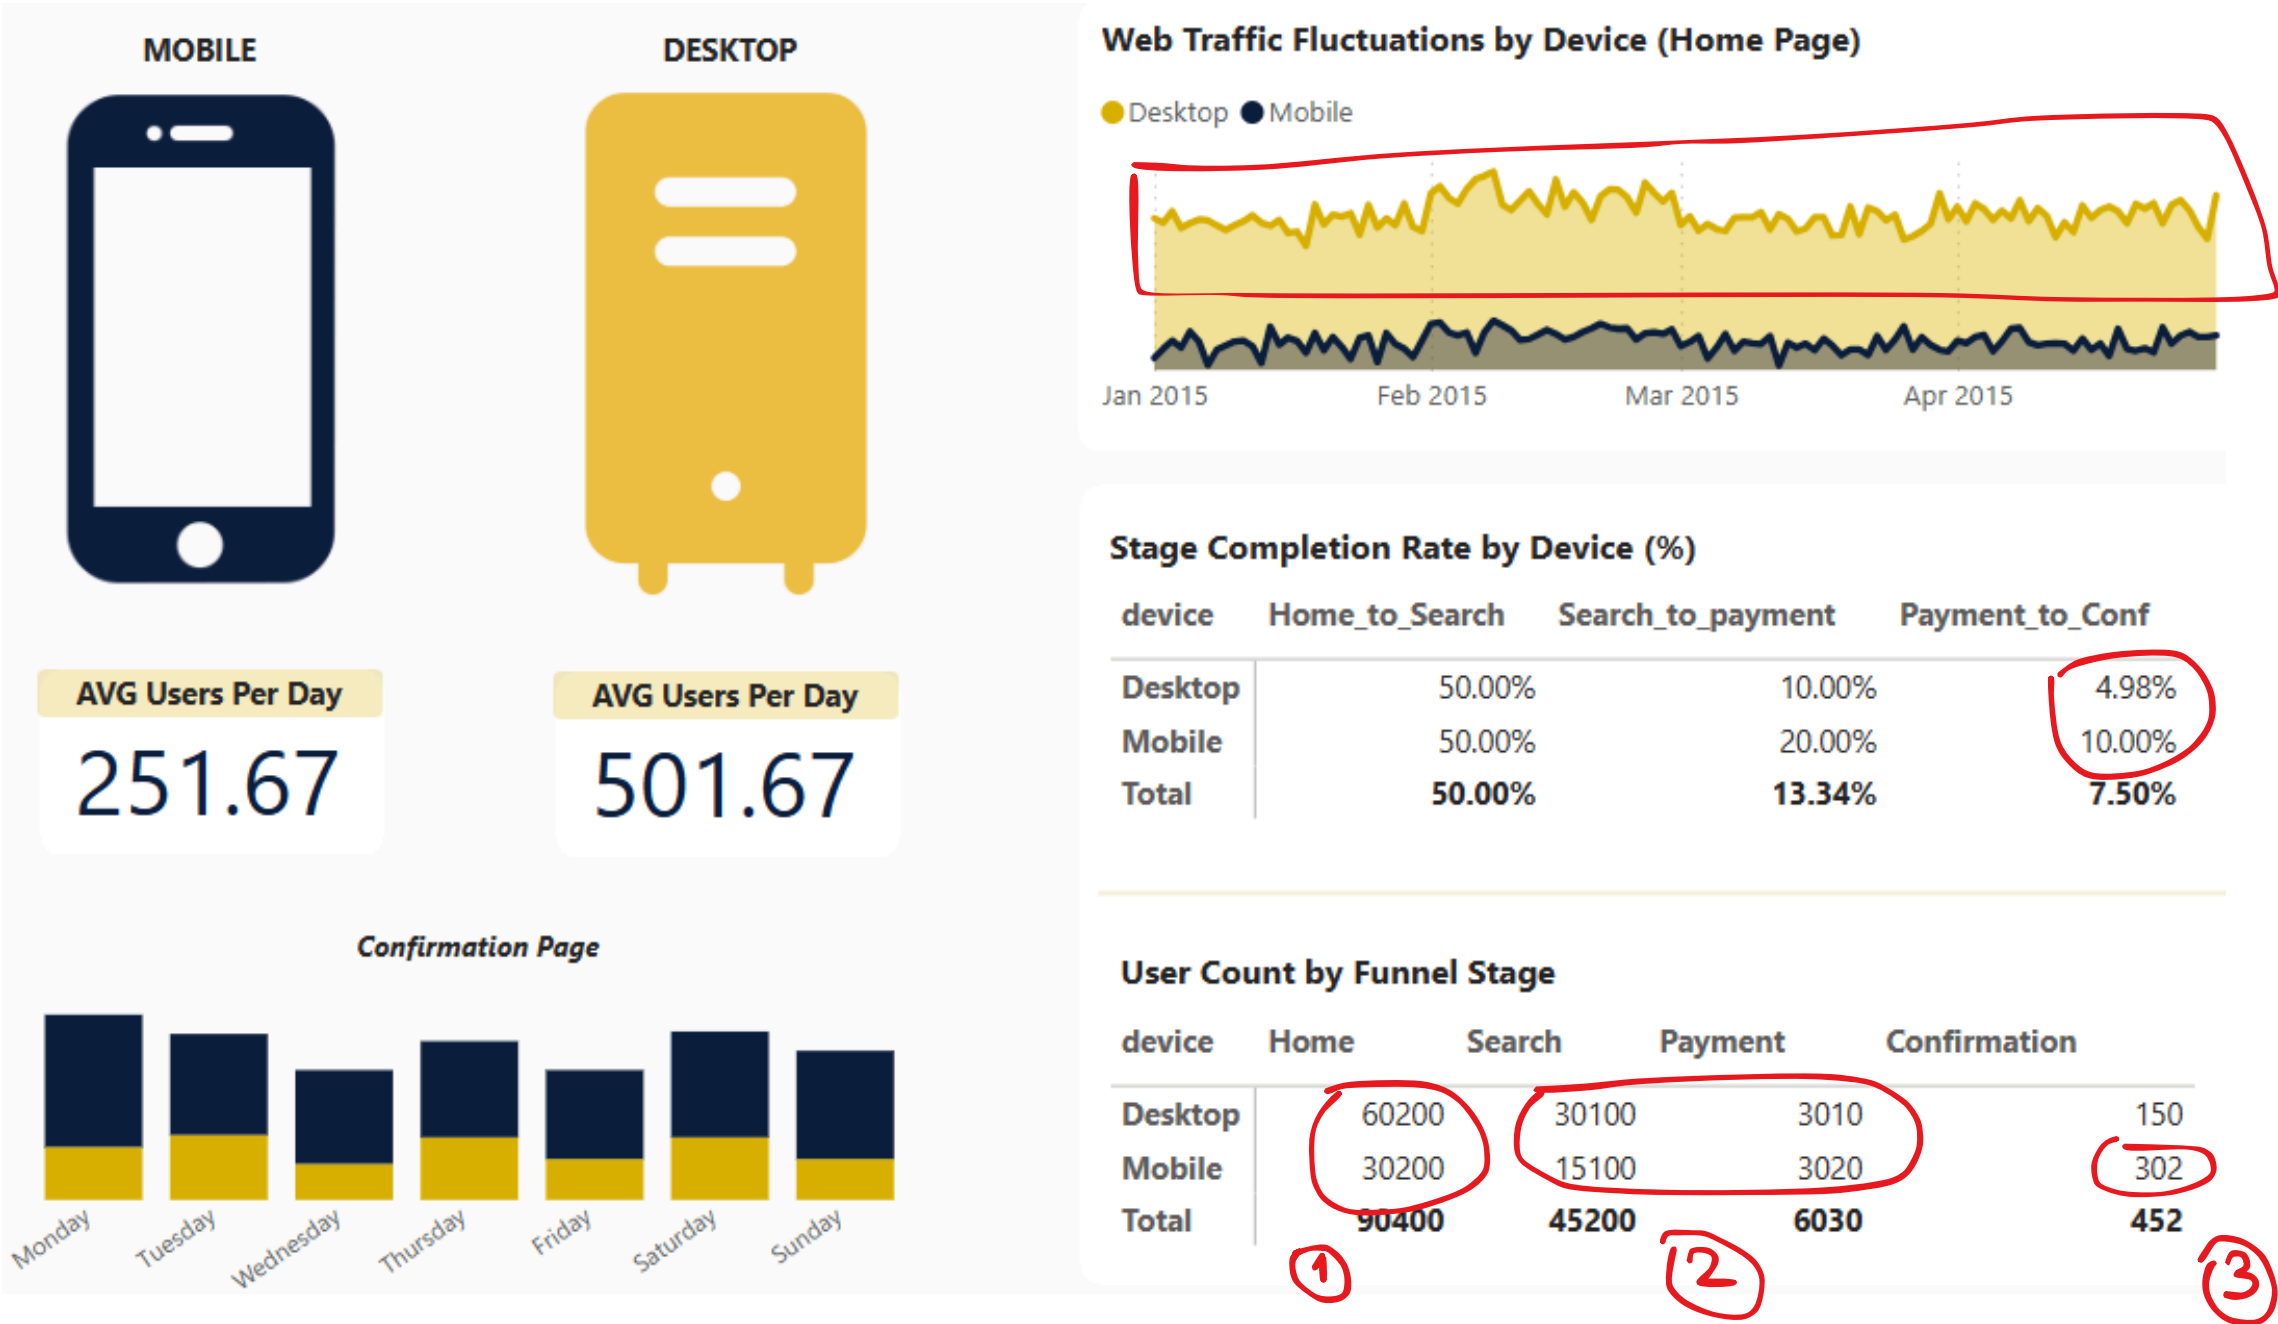

Male: 7.20% conversion rate

The issue lies within the payment flow.

Note: Additional filters and interactive views are available in the Power BI dashboard.

Conversion by Device

Mobile users convert better — despite being the minority

Even though **twice as many users** access the site from desktop, mobile users convert twice as much.

While **60,200 desktop users** visit the homepage (vs. 30,200 on mobile), the confirmation rate for mobile is **10%**, compared to just **4.98%** for desktop.

Suggestion: users might be dropping off during payment, potentially due to **UX**, trust, or session behavior.

Note: Mobile drives fewer visits, but higher conversions. Behavior is more efficient, this may be an opportunity.

Final Insights & Strategic Focus

WHAT WE LEARNED

- 99.5% of users never reach the confirmation stage — the funnel is highly inefficient.
- 50% drop-off occurs right after landing — users abandon before even searching.
- Only 7.5% of users who reach the payment page end up confirming.
- Mobile users convert at double the rate of desktop users, despite lower traffic.
- Gender is not a significant factor, both male and female users follow similar patterns.

WHAT NEEDS TO BE INVESTIGATED

- Why are users leaving during payment?
- Is the checkout page confusing or hard to trust?
- Are there slow pages or places where users give up quickly?

WHERE TO FOCUS NEXT

- Redesign or optimize the desktop checkout flow.
- Consider adapting successful mobile interaction patterns to desktop.
- Launch an A/B test to evaluate payment experience adjustments.
- Build a marketing strategy focused on days with high traffic + low conversion.

Note: All findings are supported by SQL-based analysis and an interactive Power BI dashboard.

Strategic Timing

When to Push Marketing Efforts

Funnel Breakdown by Weekday

Day Name	Home	Search	Payment	Confirmation
Monday	12955	6483	869	77
Tuesday	12697	6252	853	69
Wednesday	12831	6335	838	54
Thursday	13444	6717	899	66
Friday	12750	6406	871	54
Saturday	12801	6545	845	70
Sunday	12922	6462	855	62
Total	90400	45200	6030	452

Traffic and conversions peak on **Thursdays** and **Mondays**, making them the best candidates for targeted marketing campaigns.

Focused efforts on high-traffic + high-conversion days can maximize return on spend once the funnel is optimized.
